CONTRAST SECURITY

Five characteristics of good ADR

Not all Application Detection and Response (ADR) platforms are the same. When considering an ADR solution, first make sure the solutions you're vetting have these key characteristics.

Can it

1. Stop exploits, including zero days, before damage occurs?

2. Detect behavioral abnormalities in both custom code and libraries?

3. Pinpoint the attack's root cause with deep visibility into running code execution?

4. Correlate attacks directly to specific vulnerabilities, thereby allowing for prioritized fixes and immediate compensating controls?

5. Seamlessly integrate into your existing Security Incident and Event Management (SIEM) platforms and other SecOps workflows?
