

SOLUTION BRIEF

Contrast and ServiceNow AVR

Seamlessly manage vulnerabilities from a single location

ServiceNow and Contrast Security join forces to streamline vulnerability management, enabling faster remediation and a stronger security posture.

You can't protect what you can't see

Application Security has become a complex challenge to manage. Organizations may have hundreds to thousands of applications to secure with thousands of interlocking components such as third-party libraries and open source code. This distributed architecture expands the attack surface making it hard to monitor and secure, leading to alert fatigue, fragmented vulnerability management systems and an overwhelming volume of threats. Many find themselves bogged down by manual tasks, managing updates in multiple systems and chasing false positives. This hinders their ability to focus on actual risk mitigation, resulting in slow response times to critical vulnerabilities and a diminished overall security posture.

Application security with a unified solution

Contrast Security and ServiceNow join forces to streamline vulnerability remediation. Contrast embeds itself within applications, providing always-on security and pinpointing vulnerabilities with laser precision. This vital vulnerability data, across all environments from development to production, is relayed to ServiceNow AVR. Users will be notified of a new ticket complete with the information required to remediate the vulnerability. This holistic view will improve efficiency and meet users where they work, with updates relayed seamlessly back to Contrast.

This empowers teams to realize the following benefits:

Reduced manual effort

Manually creating tickets and updating information across systems is time-consuming and inefficient. The integration automates these tasks, freeing up security teams to focus on other critical activities.

Enhanced security posture

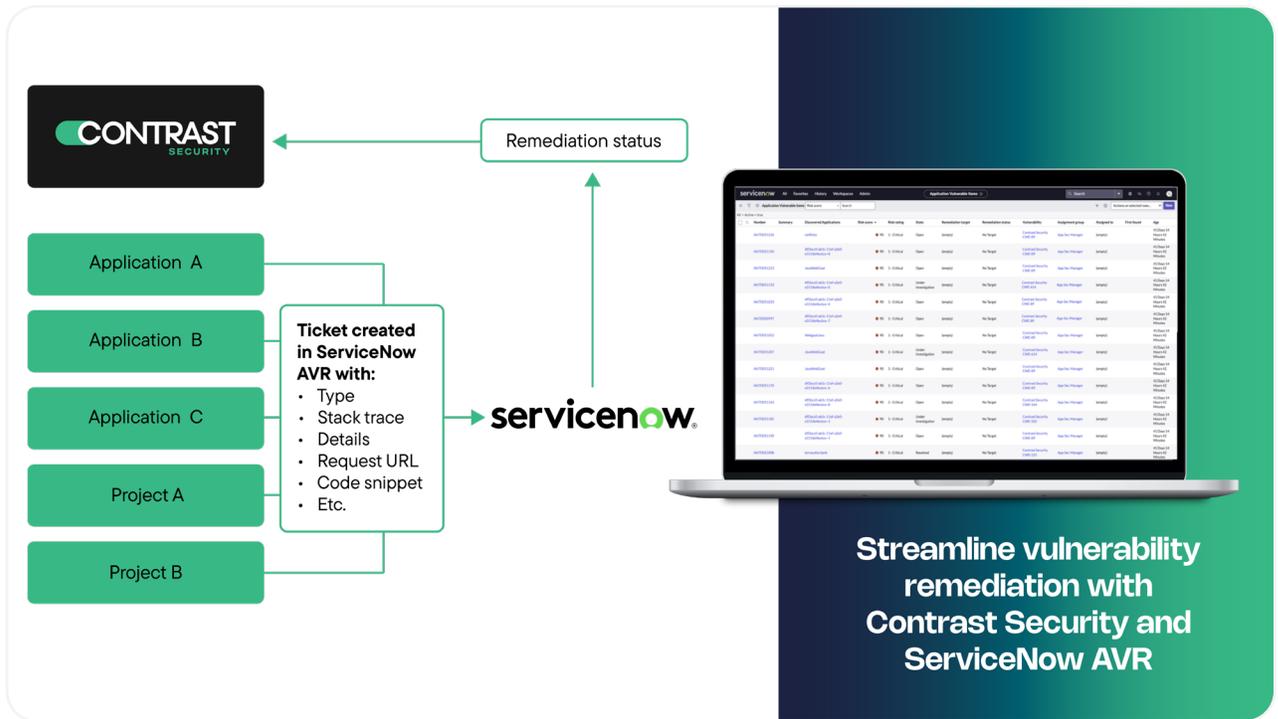

By streamlining vulnerability management, improving visibility and accelerating remediation, organizations can strengthen their overall security posture and reduce their risk exposure.

Faster time to remediation

Rapidly address vulnerabilities that matter, directly in ServiceNow AVR. Contrast Security's unbeatable accuracy exposes runtime vulnerabilities and reduces false positives, and passes data directly to ServiceNow AVR, saving significant time on risk assessment, investigation and remediation.

Solving application security challenges

Streamlined application vulnerability management for faster remediation

Challenge: Organizations struggle with managing vulnerabilities from multiple security tools. They need a way to minimize false positives, accelerate remediation efforts and streamline updates between systems.

Solution: The integration between ServiceNow AVR and Contrast Security provides a bidirectional sync of vulnerability data, creating a single source of truth for managing and remediating application vulnerabilities. Contrast will open a ticket in Service AVR, which will notify users to begin their review. As the user makes changes in ServiceNow, this is relayed to Contrast ensuring that both systems are always in sync. This automated process eliminates manual effort, reduces time to remediation and enhances the overall security posture.
